Arthroscopy punches

Optimum cleaning without loss of stability thanks to the additional downward-opening guide in the shaft.

Jaw part height

Width of cut

Jaw part width

Straight

Shaft and jaw part are straight

Upbiter

Jaw part is angled up to allow easier access to the rear part of the meniscus

Upswept

Instrument is curved up at the shaft. It follows the contour of the condyle and keeps the cut surface parallel to the tibial plateau.

Hip

In the arthroscopic treatment of femoroacetabular impingement of the Cam type, precise resection of the bony protrusions on the head-neck junction near the joint is a particular challenge.

In order to avoid under or over-correction, a good overview is needed. While this is normally ensured in the ventral portion of the femoral neck, the overview may be limited during milling at the lateral and especially in posterolateral regions.

The design of the Hip-perfect burr enables a good view even of these hard-to-reach places due to its special curvature and narrow design. The especially machined ball head enables reliable milling in nearly all positions.

There are various approaches in the treatment of osteonecrosis of the femoral head which use autologous cancellous bone. Many of these procedures involve drilling the area of necrotic bone (core decompression), and some also include additional evacuation of the necrotic bone.

The Piloted Bone Trepine is a useful supplementary instrument for core decompression which enables simpler and safe removal of cancellous bone from the femoral neck without further OP trauma.

SJ punches

This selection of instruments has been put together specifically for small joints. Shorter shafts as well as smaller jaw parts offer ideal access for elbows, wrists, and ankles.

Optimum cleaning without loss of stability thanks to the additional downward-opening guide in the shaft.

Straight

Shaft and jaw part are straight

Upbiter

Jaw part is angled up to allow easier access to the rear part of the meniscus

Upswept

Instrument is curved up at the shaft. It follows the contour of the condyle and keeps the cut surface parallel to the tibial plateau.
